

APPARATUS FOR DEFLECTING OR INVERTING MOVING WEBS

Abstract

5 A slat roller wherein the translation of slats permits a non-normal angle of incidence of a moving web to the longitudinal axis of the roller. The non-normal angle of incidence and the translation of the slats permit the axial movement of the web when the web is in contact with slats of the roller. One or more of the slat rollers may be employed in a system for inverting a moving web of indefinite length material.
